

HS-PS1-2

Students who demonstrate understanding can:

HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties. [Clarification Statement: Examples of chemical reactions could include the reaction of sodium and chlorine, of carbon and oxygen, or of carbon and hydrogen.] [Assessment Boundary: Assessment is limited to chemical reactions involving main group elements and combustion reactions.]

The performance expectation above was developed using the following elements from *A Framework for K-12 Science Education*:

Science and Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<p>Constructing Explanations and Designing Solutions</p> <p>Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories.</p> <ul style="list-style-type: none"> Construct and revise an explanation based on valid and reliable evidence obtained from a variety of sources (including students' own investigations, models, theories, simulations, and peer review) and the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future. 	<p>PS1.A: Structure and Properties of Matter</p> <ul style="list-style-type: none"> The periodic table orders elements horizontally by the number of protons in the atom's nucleus and places those with similar chemical properties in columns. The repeating patterns of this table reflect patterns of outer electron states. <p>PS1.B: Chemical Reactions</p> <ul style="list-style-type: none"> The fact that atoms are conserved, together with knowledge of the chemical properties of the elements involved, can be used to describe and predict chemical reactions. 	<p>Patterns</p> <ul style="list-style-type: none"> Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.

Observable features of the student performance by the end of the course:

1	Articulating the explanation of phenomena								
	a Students construct an explanation of the outcome of the given reaction, including: <table border="1" style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td style="width: 20px;">i.</td> <td>The idea that the total number of atoms of each element in the reactant and products is the same;</td> </tr> <tr> <td>ii.</td> <td>The numbers and types of bonds (i.e., ionic, covalent) that each atom forms, as determined by the outermost (valence) electron states and the electronegativity;</td> </tr> <tr> <td>iii.</td> <td>The outermost (valence) electron state of the atoms that make up both the reactants and the products of the reaction is based on their position in the periodic table; and</td> </tr> <tr> <td>iv.</td> <td>A discussion of how the patterns of attraction allow the prediction of the type of reaction that occurs (e.g., formation of ionic compounds, combustion of hydrocarbons).</td> </tr> </tbody> </table>	i.	The idea that the total number of atoms of each element in the reactant and products is the same;	ii.	The numbers and types of bonds (i.e., ionic, covalent) that each atom forms, as determined by the outermost (valence) electron states and the electronegativity;	iii.	The outermost (valence) electron state of the atoms that make up both the reactants and the products of the reaction is based on their position in the periodic table; and	iv.	A discussion of how the patterns of attraction allow the prediction of the type of reaction that occurs (e.g., formation of ionic compounds, combustion of hydrocarbons).
i.	The idea that the total number of atoms of each element in the reactant and products is the same;								
ii.	The numbers and types of bonds (i.e., ionic, covalent) that each atom forms, as determined by the outermost (valence) electron states and the electronegativity;								
iii.	The outermost (valence) electron state of the atoms that make up both the reactants and the products of the reaction is based on their position in the periodic table; and								
iv.	A discussion of how the patterns of attraction allow the prediction of the type of reaction that occurs (e.g., formation of ionic compounds, combustion of hydrocarbons).								
2	Evidence								
	a Students identify and describe the evidence to construct the explanation, including: <table border="1" style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td style="width: 20px;">i.</td> <td>Identification of the products and reactants, including their chemical formulas and the arrangement of their outermost (valence) electrons;</td> </tr> <tr> <td>ii.</td> <td>Identification that the number and types of atoms are the same both before and after a reaction;</td> </tr> <tr> <td>iii.</td> <td>Identification of the numbers and types of bonds (i.e., ionic, covalent) in both the reactants and the products;</td> </tr> <tr> <td>iv.</td> <td>The patterns of reactivity (e.g., the high reactivity of alkali metals) at the macroscopic</td> </tr> </tbody> </table>	i.	Identification of the products and reactants, including their chemical formulas and the arrangement of their outermost (valence) electrons;	ii.	Identification that the number and types of atoms are the same both before and after a reaction;	iii.	Identification of the numbers and types of bonds (i.e., ionic, covalent) in both the reactants and the products;	iv.	The patterns of reactivity (e.g., the high reactivity of alkali metals) at the macroscopic
i.	Identification of the products and reactants, including their chemical formulas and the arrangement of their outermost (valence) electrons;								
ii.	Identification that the number and types of atoms are the same both before and after a reaction;								
iii.	Identification of the numbers and types of bonds (i.e., ionic, covalent) in both the reactants and the products;								
iv.	The patterns of reactivity (e.g., the high reactivity of alkali metals) at the macroscopic								

		level as determined by using the periodic table; and
	v.	The outermost (valence) electron configuration and the relative electronegativity of the atoms that make up both the reactants and the products of the reaction based on their position in the periodic table.
3	Reasoning	
	a	Students describe their reasoning that connects the evidence, along with the assumption that theories and laws that describe their natural world operate today as they did in the past and will continue to do so in the future, to construct an explanation for how the patterns of outermost electrons and the electronegativity of elements can be used to predict the number and types of bonds each element forms.
	b	In the explanation, students describe the causal relationship between the observable macroscopic patterns of reactivity of elements in the periodic table and the patterns of outermost electrons for each atom and its relative electronegativity.
4	Revising the explanation	
	a	Given new evidence or context, students construct a revised or expanded explanation about the outcome of a chemical reaction and justify the revision.
