Crosscutting concepts are equally important partners with the other two dimensions in today’s science standards, providing students with intellectual tools and connections across disciplines that can enrich the use of practices and understanding of core ideas. Although crosscutting concepts are now part of most states’ learning goals, they are still not often assessed. The latest post from NextGenScience’s *On The Same Wavelength* blog explores questions related to assessing crosscutting concepts and considerations for student learning.

2. **Attending to Student Interests and Community Priorities in Phenomena**

This one-hour professional learning facilitation module is designed to deepen participants' capacity to identify a variety of instructionally productive and meaningful phenomena. Participants consider effective use of phenomena in a classroom and their importance for ensuring all students engage in science and engineering.

3. **Reimagining Science Education: The Pathway to Convergence Education**

In this panel discussion hosted by the U.S. Department of Education, policymakers and practitioners will come together to discuss the growing interdisciplinary nature of real-world issues in the science classroom, promising practices, and the benefits for students when we don’t teach and learn in silos.

Commentary: California Must Prioritize Science Education to Stay Competitive

Learner populations—continued to use science content to engage students in ELA and math [during the 2020-21 school year]. This helped ensure that science education continued in these districts amid the pandemic.”

See the EdSource commentary about a recent PPIC report on the impact of COVID-19 on science education here and a PPIC virtual event recording about the same report here.

Safety Lessons Learned From the COVID-19 Pandemic

The COVID-19 pandemic caused schools to increase focus on safety and health for students in school and the science classroom. This NSTA blog post discusses ways to promote STEM safety during hands-on activities and demonstrations, including lessons learned from modifications to safety protocols made during the COVID-19 pandemic.

See the blog post here.
Last year, EdReports and NextGenScience teamed up to create a resource that describes some of the most important features of instructional materials that are based on *A Framework for K–12 Science Education*. Intended for both educator and science curriculum developer audiences, it reflects findings based on hundreds of reviews of science instructional materials, implications for the field, and examples of what these features can look like.

See the resource and a corresponding webinar recording here.
